

Implicit Data Type Conversion

expressions

From			То
VARCHAR2	or	CHAR	NUMBER
VARCHAR2	or	CHAR	DATE

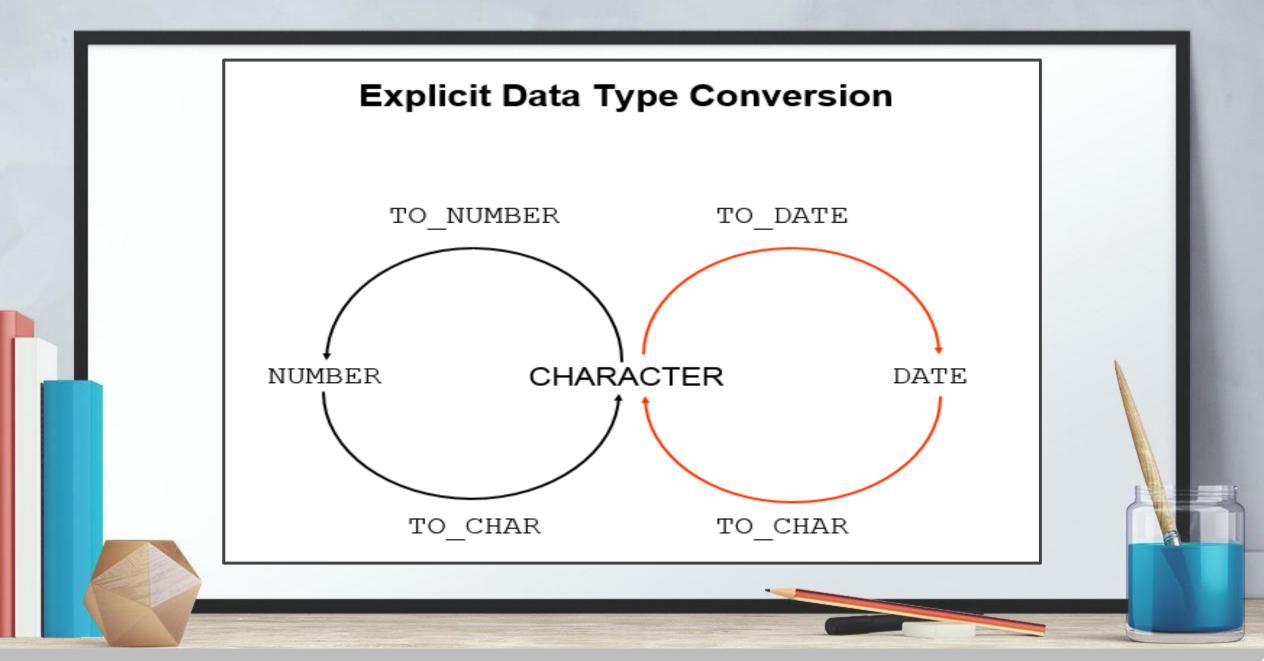

SELECT * FROM employees
WHERE EMPLOYEE_ID='100'
OR HIRE_DATE='21-SEP-05';

expression evaluation

From	То
NUMBER	VARCHAR2 or CHAR
DATE	VARCHAR2 or CHAR

SELECT CONCAT(EMPLOYEE_ID, FIRST_NAME),
CONCAT(HIRE_DATE, FIRST_NAME)
FROM EMPLOYEES;

Note: Although implicit data type conversion is available, it is recommended that you do the explicit data type conversion to ensure the reliability of your SQL statements.

Using the TO CHAR Function with Dates

```
TO_CHAR(date[,'format_model'])
```

The format model:

- Must be enclosed with single quotation marks
- Is case-sensitive
- Can include any valid date format element
- Has an fm element to remove padded blanks or suppress leading zeros
- Is separated from the date value by a comma

Elements of the Date Format Model

Element	Result	
YYYY	Full year in numbers	
YEAR	Year spelled out (in English)	
MM	Two-digit value for the month	
MONTH	Full name of the month	
MON	Three-letter abbreviation of the month	
DY	Three-letter abbreviation of the day of the week	
DAY	Full name of the day of the week	
DD	Numeric day of the month	

time format

Element	Description
AM or PM	Meridian indicator
A.M. or P.M.	Meridian indicator with periods
HH or HH12	12 hour format
HH24	24 hour format
MI	Minute (0–59)
SS	Second (0-59)
SSSSS	Seconds past midnight (0–86399)

Other Formats

Element	Description
/ . , - :	Punctuation is reproduced in the result.
"of the"	Quoted string is reproduced in the result.

Specifying Suffixes to Influence Number Display

Element	Description	
TH	Ordinal number (for example, DDTH for 4TH)	
SP	Spelled-out number (for example, DDSP for FOUR)	
SPTH or THSP	Spelled-out ordinal numbers (for example, DDSPTH for FOURTH)	

Using the TO CHAR Function with Numbers

```
TO_CHAR(number[, 'format_model'])
```

These are some of the format elements that you can use with the TO_CHAR function to display a number value as a character:

Element	Result	
9	Represents a number	
0	Forces a zero to be displayed	
\$	Places a floating dollar sign	
L	Uses the floating local currency symbol	
	Prints a decimal point	
1	Prints a comma as a thousands indicator	

Element	Description	Example	Result
9	Numeric position (number of 9s determine display width)	999999	1234
0	Display leading zeros	099999	001234
\$	Floating dollar sign	\$999999	\$1234
L	Floating local currency symbol	L999999	FF1234
D	Returns the decimal character in the specified position. The default is a period (.).	9999D99	1234.00
	Decimal point in position specified	999999.99	1234.00
G	Returns the group separator in the specified position. You can specify multiple group separators in a number format model.	9G999	1,234
,	Comma in position specified	999,999	1,234
MI	Minus signs to right (negative values)	999999MI	1234-
PR	Parenthesize negative numbers	999999PR	<1234>
EEEE	Scientific notation (format must specify four Es)	99.999EEEE	1.234E+03
U	Returns in the specified position the "Euro" (or other) dual currency	U9999	€1234
V	Multiply by 10 n times (n = number of 9s after \lor)	9999\/99	123400
S	Returns the negative or positive value	S9999	-1234 or +1234
В	Display zero values as blank, not 0	B9999.99	1234.00

Using the TO_NUMBER and TO_DATE Functions

 Convert a character string to a number format using the TO_NUMBER function:

```
TO_NUMBER(char[, 'format_model'])
```

Convert a character string to a date format using the TO_DATE function:

```
TO_DATE(char[, 'format_model'])
```

These functions have an fx modifier. This modifier specifies the exact match for the character argument and date format model of a TO DATE function.

General Functions

The following functions work with any data type and pertain to using nulls:

- NVL (expr1, expr2)
- NVL2 (expr1, expr2, expr3)
- NULLIF (expr1, expr2)
- COALESCE (expr1, expr2, ..., exprn)

Function	Description
NVL	Converts a null value to an actual value
NVL2	If expr1 is not null, NVL2 returns expr2. If expr1 is null, NVL2 returns expr3. The argument expr1 can have any data type.
NULLIF	Compares two expressions and returns null if they are equal; returns the first expression if they are not equal
COALESCE	Returns the first non-null expression in the expression list

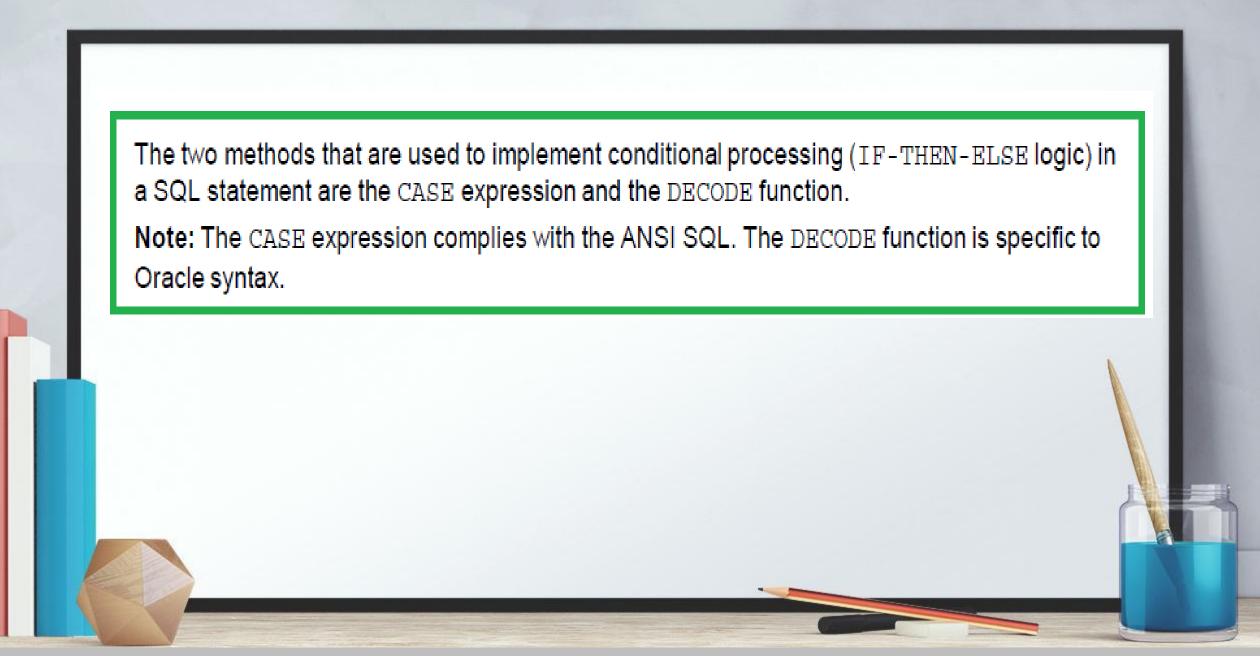

NVL Function

Converts a null value to an actual value:

- Data types that can be used are date, character, and number.
- Data types must match:
 - NVL(commission_pct,0)
 - NVL(hire date, '01-JAN-97')
 - NVL(job_id,'No Job Yet')

Conditional Expressions

- Provide the use of the IF-THEN-ELSE logic within a SQL statement.
- Use two methods:
 - CASE expression
 - DECODE function

CASE Expression

Facilitates conditional inquiries by doing the work of an IF-THEN-ELSE statement:

```
CASE expr WHEN comparison_expr1 THEN return_expr1
[WHEN comparison_expr2 THEN return_expr2
WHEN comparison_exprn THEN return_exprn
ELSE else_expr]
END
```

DECODE Function

Facilitates conditional inquiries by doing the work of a CASE expression or an IF-THEN-ELSE statement:

```
DECODE(col/expression, search1, result1
      [, search2, result2,...,]
      [, default])
```
