# Retrieving Data Using the SQL SELECT Statement

## **Objectives**

After completing this lesson, you should be able to do the following:

- List the capabilities of SQL SELECT statements
- Execute a basic SELECT statement
- Differentiate between SQL statements and iSQL\*Plus commands

## Capabilities of SQL SELECT Statements

## **Basic SELECT Statement**

```
SELECT *|{[DISTINCT] column|expression [alias],...}
FROM table;
```

- SELECT identifies the columns to be displayed
- FROM identifies the table containing those columns

# **Selecting All Columns**

SELECT \*
FROM departments;

DEPARTMENT_ID	DEPARTMENT_NAME	MANAGER_ID	LOCATION_ID
10	Administration	200	1700
20	Marketing	201	1800
50	Shipping	124	1500
60	IT	103	1400
80	Sales	149	2500
90	Executive	100	1700
110	Accounting	205	1700
190	Contracting		1700

# **Selecting Specific Columns**

```
SELECT department_id, location_id
FROM departments;
```

DEPARTMENT_ID	LOCATION_ID
10	1700
20	1800
50	1500
60	1400
80	2500
90	1700
110	1700
190	1700

## Writing SQL Statements

- SQL statements are not case-sensitive.
- SQL statements can be on one or more lines.
- Keywords cannot be abbreviated or split across lines.
- Clauses are usually placed on separate lines.
- Indents are used to enhance readability.
- In iSQL\*Plus, SQL statements can optionally be terminated by a semicolon (;). Semicolons are required if you execute multiple SQL statements.
- In SQL\*plus, you are required to end each SQL statement with a semicolon (;).

# **Column Heading Defaults**

- SQL\*Plus:
  - Default heading alignment: Center
  - Default heading display: Uppercase
- SQL\*Plus:
  - Character and Date column headings are leftaligned
  - Number column headings are right-aligned
  - Default heading display: Uppercase

## **Arithmetic Expressions**

Create expressions with number and date data by using arithmetic operators.

Operator	Description
+	Add
-	Subtract
*	Multiply
1	Divide

# **Using Arithmetic Operators**

```
SELECT last_name, salary, salary + 300
FROM employees;
```

LAST_NAME	SALARY	SALARY+300
King	24000	24300
Kochhar	17000	17300
De Haan	17000	17300
Hunold	9000	9300
Ernst	6000	6300

- - -

## **Operator Precedence**

SELECT last\_name, salary, 12\*salary+100
FROM employees;

LAST_NAME	SALARY	12*SALARY+100
King	24000	288100
Kochhar	17000	204100
De Haan	17000	204100

20 rows selected.

SELECT last\_name, salary, 12\*(salary+100)
FROM employees;

LAST_NAME	SALARY	12*(SALARY+100)
King	24000	289200
Kochhar	17000	205200
De Haan	17000	205200

## **Defining a Null Value**

- A null is a value that is unavailable, unassigned, unknown, or inapplicable.
- A null is not the same as a zero or a blank space.

```
SELECT last_name, job_id, salary, commission_pct
FROM employees;
```

LAST_NAME	JOB_ID	SALARY	COMMISSION_PCT
King	AD_PRES	24000	
Kochhar	AD_VP	17000	
Zlotkey	SA_MAN	10500	.2
Abel	SA_REP	11000	.3
Taylor	SA_REP	8600	.2
• • •			
Gietz	AC_ACCOUNT	8300	

# Null Values in Arithmetic Expressions

Arithmetic expressions containing a null value evaluate to null.

SELECT last\_name, 12\*salary\*commission\_pct FROM employees;

LAST_NAME	12*SALARY*COMMISSION_PCT
King	
Kochhar	
Zlotkey	25200
Abel Taylor	39600
Taylor	20640
•••	
Gietz	

## **Defining a Column Alias**

#### A column alias:

- Renames a column heading
- Is useful with calculations
- Immediately follows the column name (There can also be the optional AS keyword between the column name and alias.)
- Requires double quotation marks if it contains spaces or special characters or if it is casesensitive

## **Using Column Aliases**

SELECT last name AS name, commission pct comm employees; FROM COMM NAME King Kochhar De Haan 20 rows selected. SELECT last name "Name" salary\*12 "Annual Salary" employees; FROM **Annual Salary** Name King 288000 Kochhar 204000 De Haan 204000

## **Concatenation Operator**

#### important

## A concatenation operator:

- Links columns or character strings to other columns
- Is represented by two vertical bars (||)
- Creates a resultant column that is a character expression

```
SELECT last_name|||job_id AS "Employees"
FROM employees;
```

```
Employees

KingAD_PRES

KochharAD_VP

De HaanAD_VP
```

## **Literal Character Strings**

- A literal is a character, a number, or a date that is included in the SELECT statement.
- Date and character literal values must be enclosed by single quotation marks.
- Each character string is output once for each row returned.

# **Using Literal Character Strings**

```
SELECT last_name | ' is a '||job_id

AS "Employee Details"

FROM employees;
```

Employee Details		
King is a AD_PRES		
Kochhar is a AD_VP		
De Haan is a AD_VP		
Hunold is a IT_PROG		
Ernst is a IT_PROG		
Lorentz is a IT_PROG		
Mourgos is a ST_MAN		
Rajs is a ST_CLERK		

---

# **Alternative Quote (q) Operator**

- Specify your own quotation mark delimiter
- Choose any delimiter
- Increase readability and usability

```
SELECT department name ||

q'[, it's assigned Manager Id: ]'

|| manager_id

AS "Department and Manager"

FROM departments;
```

```
Department and Manager

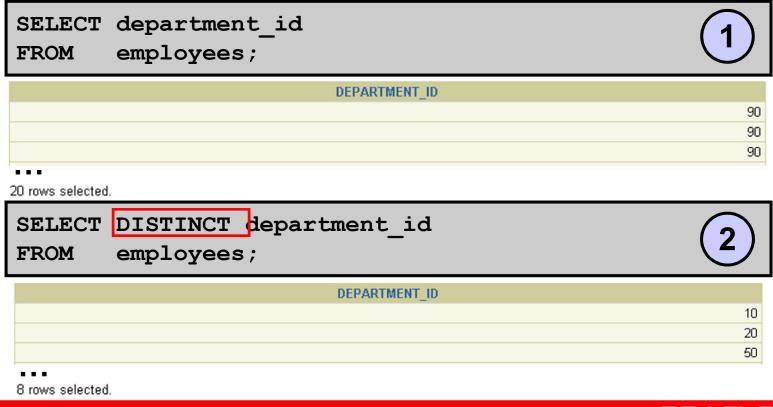

Administration, it's assigned manager ID: 200

Marketing, it's assigned manager ID: 201

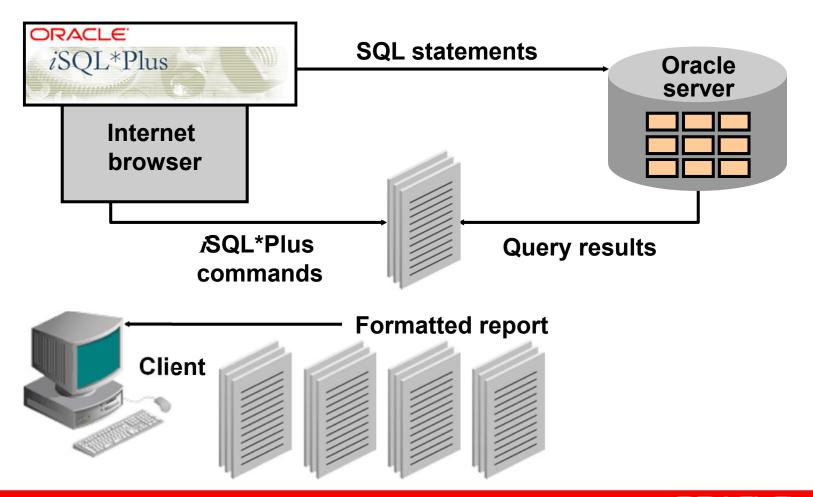

Shipping, it's assigned manager ID: 124
```

## **Duplicate Rows**

The default display of queries is all rows, including duplicate rows.

## SQL and ISQL\*Plus Interaction

# SQL Statements Versus SQL\*Plus Commands

#### **SQL**

- A language
- ANSI standard
- Keyword cannot be abbreviated.
- Statements manipulate data and table definitions in the database.

SQL statements

#### iSQL\*Plus

- An environment
- Oracle-proprietary
- Keywords can be abbreviated.
- Commands do not allow manipulation of values in the database.
- Runs on a browser
- Centrally loaded; does not have to be implemented on each machine

& SQL\*Plus commands

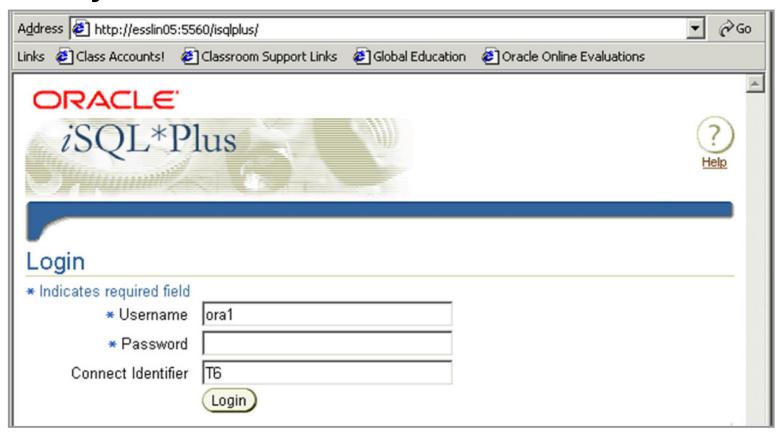

## Overview of iSQL\*Plus

## After you log in to SQL\*Plus, you can:

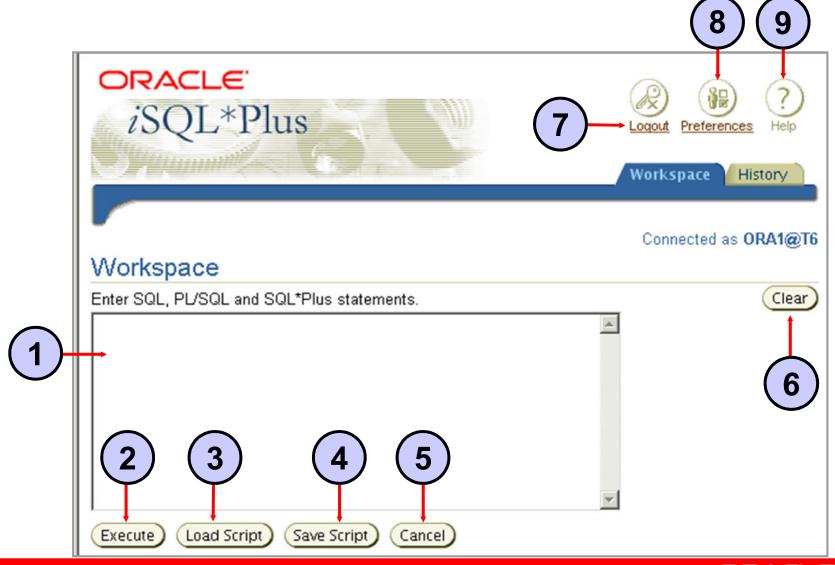

- Describe table structures
- Enter, execute, and edit SQL statements
- Save or append SQL statements to files
- Execute or edit statements that are stored in saved script files

## Logging In to SQL\*Plus

### From your browser environment:

## **SQL\*Plus Environment**

## **Displaying Table Structure**

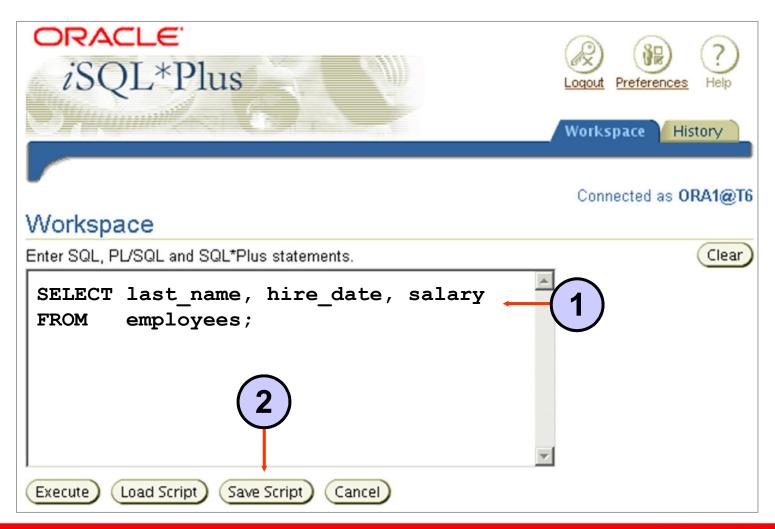

Use the SQL\*Plus DESCRIBE command to display the structure of a table:

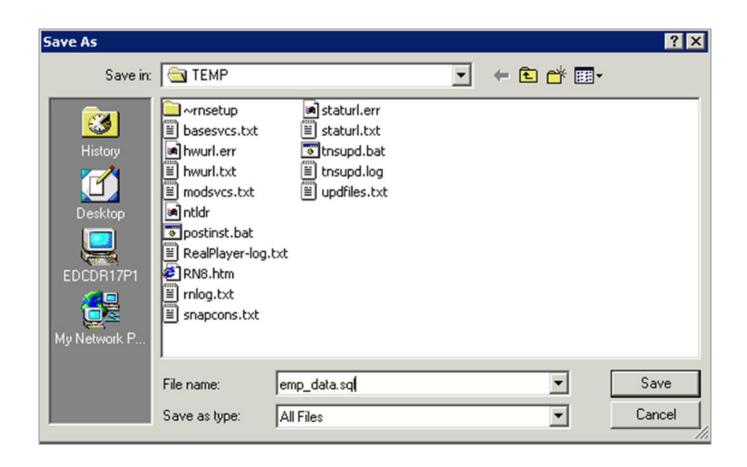

DESC[RIBE] tablename

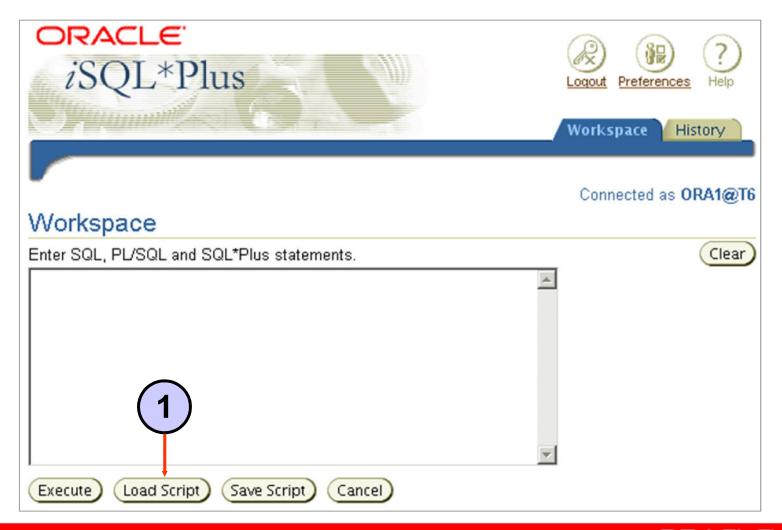

# **Displaying Table Structure**

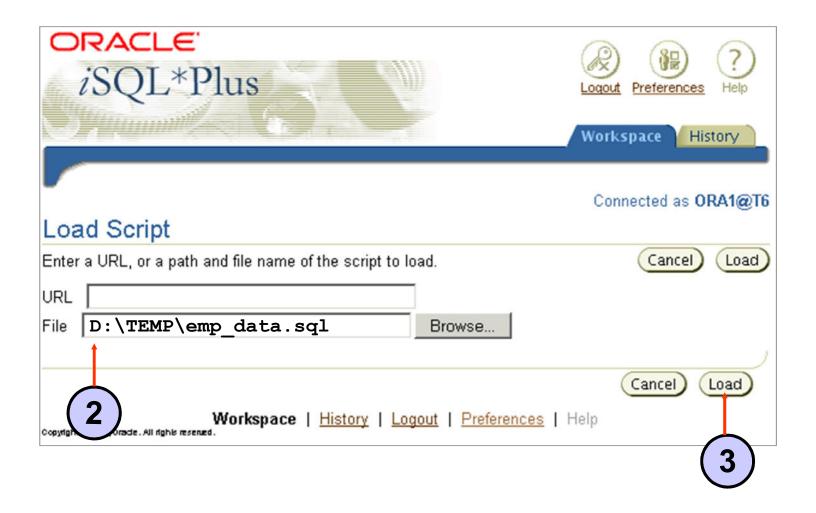

### DESCRIBE employees

Name	Null?	Туре
EMPLOYEE_ID	NOT NULL	NUMBER(6)
FIRST_NAME		VARCHAR2(20)
LAST_NAME	NOT NULL	VARCHAR2(25)
EMAIL	NOT NULL	VARCHAR2(25)
PHONE_NUMBER		VARCHAR2(20)
HIRE_DATE	NOT NULL	DATE
JOB_ID	NOT NULL	VARCHAR2(10)
SALARY		NUMBER(8,2)
COMMISSION_PCT		NUMBER(2,2)
MANAGER_ID		NUMBER(6)
DEPARTMENT_ID		NUMBER(4)

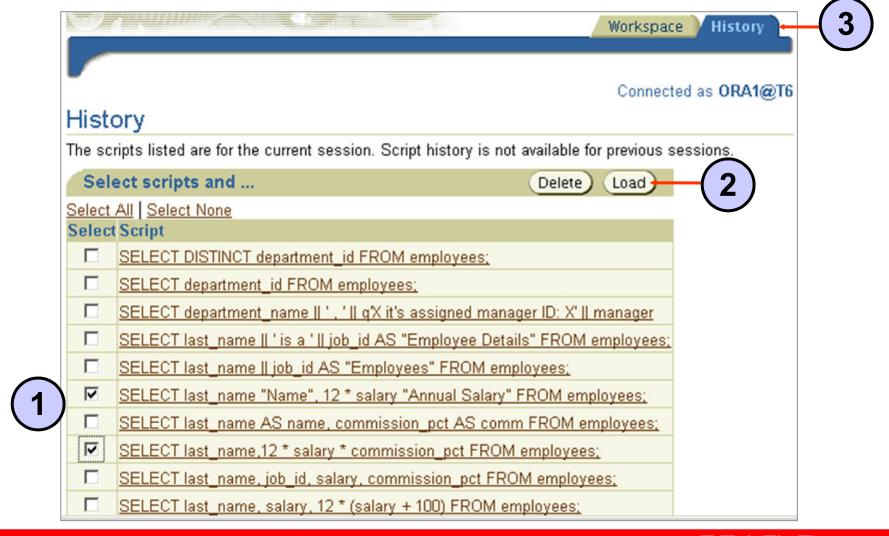

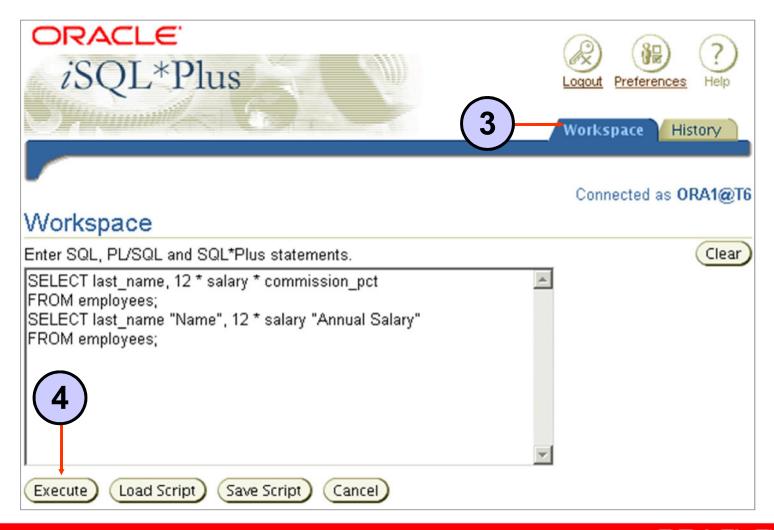

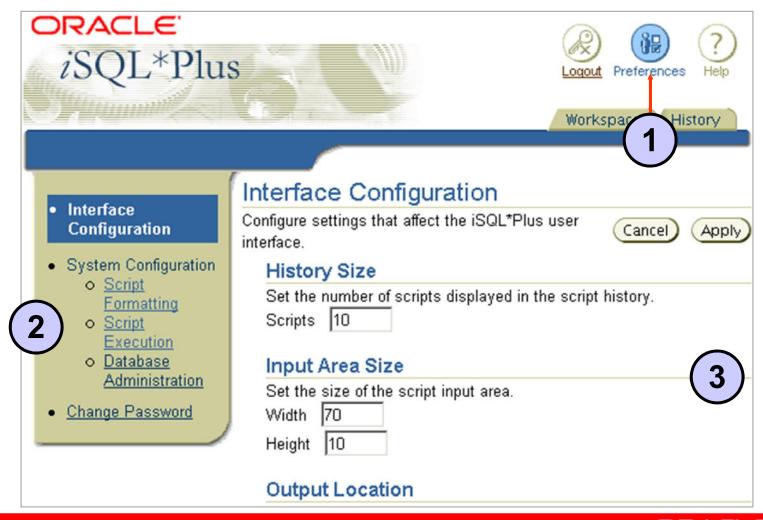

## **SQL\*Plus History Page**

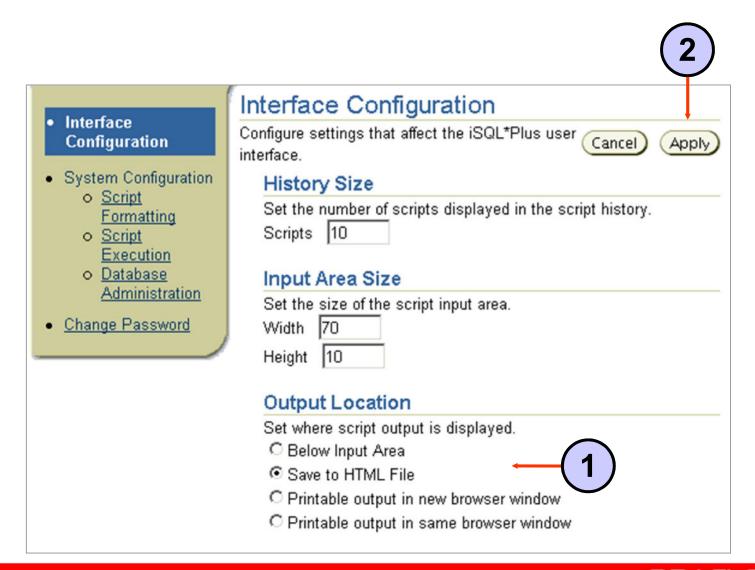

## **SQL\*Plus History Page**

## Setting \( \mathcal{S}QL^\* \) Plus Preferences

## **Setting the Output Location Preference**

## **Summary**

### In this lesson, you should have learned how to:

- Write a SELECT statement that:
  - Returns all rows and columns from a table
  - Returns specified columns from a table
  - Uses column aliases to display more descriptive column headings
- Use the SQL\*Plus environment to write, save, and execute SQL statements and SQL\*Plus commands

```
SELECT *|{[DISTINCT] column/expression [alias],...}
FROM table;
```

## **Practice 1: Overview**

## This practice covers the following topics:

- Selecting all data from different tables
- Describing the structure of tables
- Performing arithmetic calculations and specifying column names
- Using \( i \)SQL\*Plus
